```
response. The method comprises administering an immunostimulatory uncleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid immunostimulatory incleic acid. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophlus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redurect a Th1 to a Th1 immune response and to activate immune cells. Note: the
                                                                       Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infections disease; allergy; immune deficiency; phosphorothioate; ss.

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder ancer, chone cancer, barain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, leukaemia, liver cancer, eye cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, larynx cancer, pancreatic cancer, prostate cancer, rhaddomyosarcoma, skin cancer, prostate cancer, rhaddomyosarcoma, skin cancer, stonach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                            Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       administering at least one antianglogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted anglogenesis. The method is useful for inhibiting anglogenesis associated with solid tumour growth, tumour metastasis, precancerous lession, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial anglogenesis, plaque neovascularisation, telanglectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hypertrophic scars. The present sequence is an antianglogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           comprising
  rubeosis; Osler-Webber Syndrome; myocardial angiogenesis;
plaque neovascularisation; telangiectasia; haemophiliac joint;
angiofibroma; wound gramulation; intestinal adhesion; atherosclerosis;
scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosling and/or treating asthma and allergy especially in a hypo-responative subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                  The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulocrative collitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allery, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

The present invention describes a filamentous fungus (I) comprising an exogenous polynucleotide capable of expressing a Bcl-2 polypeptide or its active portion, and exhibiting accelerated growth as compared to a wild-type filamentous fungus. Also described: (I) enhancing (M1) growth of filamentous fungus, involving providing the filamentous fungus with a Bcl cilamentous fungus, involving providing the filamentous fungus with a Bcl cilamentous fungus storied at aboptimal temperature; (3) increasing of a filamentous fungus storied at aboptimal temperature; (3) increasing culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 culture medium (II) suitable for growth of fungus, comprising Bcl-2 colletorics active portion, and a carbon source; and (5) a colletorichum gloeosporioides f.sp. aeschynomene. (M1) is useful for cocoding a suitable gene. Bcl-2 has herbicide activities. (I) is colletorichum gloeosporioides f.sp. aeschynomene. (M1) is useful for cradicating an unwanted weed growing in a crop field, which is nuclea weed spreading (I) in the crop field which is pathogenic to the unwanted weed spreading (I) in the crop field which is pathogenic to the unwanted weed spreading (I) in the crop field which is pathogenic to the unwanted weed scand drug production, paper and pulp industry, agriculture and collection. (I) remains viable in storage for a time period longer than the wild-type filamentous fungus when grown on solid media. (I) chartess, as compared to the wild-type filamentous fungus. The present sequence represents a PCR primer for the human Bcl-2 gene, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                              Novel filamentous fungus having exogenous polynucleotide expressing Bcl-2 polypeptide, and exhibiting accelerated growth compared to wild- type filamentous fungus, useful for eradicating unwanted weed growing in crop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene; human; episome; transfection; selection; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The signal sequence was isolated from barley alpha-amylase cDNA by PCR using the primers given in AAQ86577-78. The product was cloned into BBLUBSCTIPILI together with a mouse MHC II alpha chain mature peptidenence to obtain plasmid p8M155, for expression in tobacco cv. SRI transformants.                                                                                                                                                                              The present 5' primer was used with the 3' primer given in AAA50260 for the PCR amplification of Bcl2 DNA, introducing a 5' BsiWI site and a 3' MneI site. The PCR product was incorporated into an episome to demonstrate a method of the invention. The method relates to the maintenance and selection of episomes in transfected eukaryotic cells in vitro or in vivo, e.g. for gene therapy. It involves transfecting the cells with an episome under conditions in which cells that survive are successfully transfected with the episome. The resulting cells express a first protein whose expression causes cell death and a second protein whose expression causes cell death and a second protein first protein. In an example of the method, bcl2 and bad, and df445 and cide-1, were used as kill antegonist and kill agonist pairs in episomes used to transfect 293E cells. The method allows the rapid establishment
                                                                                                                                                                                                                                                                                                                       eukaryotic cells that stably and reliably express a gene of interest
                                                                                                                            Stably transfecting eukaryotic cells with at least one episome for the production of a desired protein in vitro and for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apoptosis; bcl-2; resistance; bacterial; viral; pathogens; PCR primer;

                                                                                                                        The present invention relates to the use of apoptotic genes in the the production of transgenic plants with improved resistance characteristics. The present sequence is the mutagenic PCR primer Bc12-5. This primer was used with primer Bc12-3 (AAA48985) to introduce a 5' Ncol site and a 3' Xbal site in the human apoptotic gene bc1-2. Specifically the primer introduced an Ala residue between the Met (position 1) and His (position 2) residues of the native protein. The altered bc1-2 sequence was used in the creation of the final vector used to transform plants. The improved resistance characteristics of the plants helps protect against bacterial, viral and other pathogens. Resistance to abiotic challenges may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid regulatory sequences, which are able to regulate expression of a gene operably linked to a promoter, useful for regulating the expression of transgenes and for treating e.g., cancer and

                                         The invention describes an isolated nucleic acid regulatory sequence for a cyclin D1 promoter, a CD40L promoter, vancomycin-resistant enterococci (VRE) promoter, an HBV promoter, and receptor (RR) promoter. Human epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase regulate expression of the endogenous, autologous or heterologous genes operably linked to the promoter, and may be incorporated into heterologous nucleic acid constructs for use in regulated expression of transgenes. Regulated expression of cyclin D1 can be used in cancer therapies, such as breast, colon or pancreatic cancers and familial adenomatous polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, such as activity of ED40L gene promoter autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus erythematosus (SLE), graft-ve-host disease (GVHD) and rhematoid arthitis. Regulated expression of genes under the control of the HBV (hepaticis B)-specific core, pre-S and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepatocellular carcinoma, and in the regulated expression of the vall gene promoter can be used in treatment of Enterococcus infection, while regulated expression of the androgen receptor gene can be used in the invention to determine the regulatory regions involved in gene expression, codescribed in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection; bacterial infection; fungal infection, parasitic infection, cancer, asthma, infections allergy, immune deficiency, phosphorothioate; ss.

                                                                        The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to inhibiting angiogenesis in a subject, comprising

ö
              included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler Webber Syndrome, myocardial angiogenesis, plaque meovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, barain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larymx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, nelanoma, melanoma, oral cavity cancer, ovarian cancer, pandreatic cancer, prostate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The
